Introduction

Web Dynpro, the programming technology from the SAP stable, offers tremendous flexibility for User Interface (UI) design. The Web Dynpro framework, coupled with the Java Development Infrastructure, enables the design and development of powerful platform-independent meta-model-driven web applications. With applications designed in line with the Model-View-Controller (M-V-C) paradigm, Web Dynpro applications facilitate the clear separation of the UI design from the business/application logic.

There are a number of SDN weblogs and tutorials that introduce you to the concepts and methods of building Web Dynpro applications. In this article, I would like to point out the areas where one could use this powerful programming model. Knowing the technology is a definite step in the right direction. Here I present a scenario in which the power of this programming methodology is put to a test.

ORGA is a very successful organization in the retail front. Catering to a diverse consumer market, ORGA has many customers aligned with it, providing a collaborative business environment. ORGA runs its businesses on SAP R/3, the enterprise package responsible for a considerable increase in efficiency. This propelled ORGA to enter into untapped market areas and expand its global operations. Later, ORGA implemented the SAP Customer Relationship Management (CRM) solution to support its customer needs spanning various geographies. With emerging challenges, ORGA embraces the Enterprise Services Architecture (ESA) and implements SAP NetWeaver as a ramp-up customer. Thus, the IT landscape of ORGA is outlined as:

- Business Backbone - SAP R/3 Enterprise
- CRM - SAP CRM 4.0
- ESA - SAP NetWeaver '04

As the SAP NetWeaver gains ground and trust throughout the IT world, the unique challenge of harnessing the power of the SAP NetWeaver suite is also key to the success of ORGA.

The Challenge

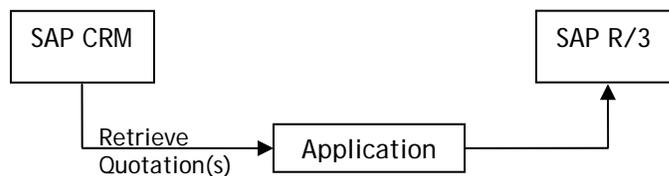

ORGA wants to streamline its process of creating sales orders. The company wishes to create all its sales orders from the quotations created in the SAP CRM system. From a business perspective, the required application should connect to the SAP CRM system, where it retrieves the details of the quotation based on the partner functions (sold-to-party/ship-to-party). The details of the quotations thus returned could be modified or retained; following this, sales orders for the quotations just processed must be created in the SAP R/3 system.

From a solution standpoint, we see a real opportunity to use the Web Dynpro programming model. The application would be developed as a portal-based Web Dynpro application, which would offer the user with the prospect of creating sales orders on-the-fly.

The Web Dynpro application would involve work on the SAP ABAP/4 and Java fronts.

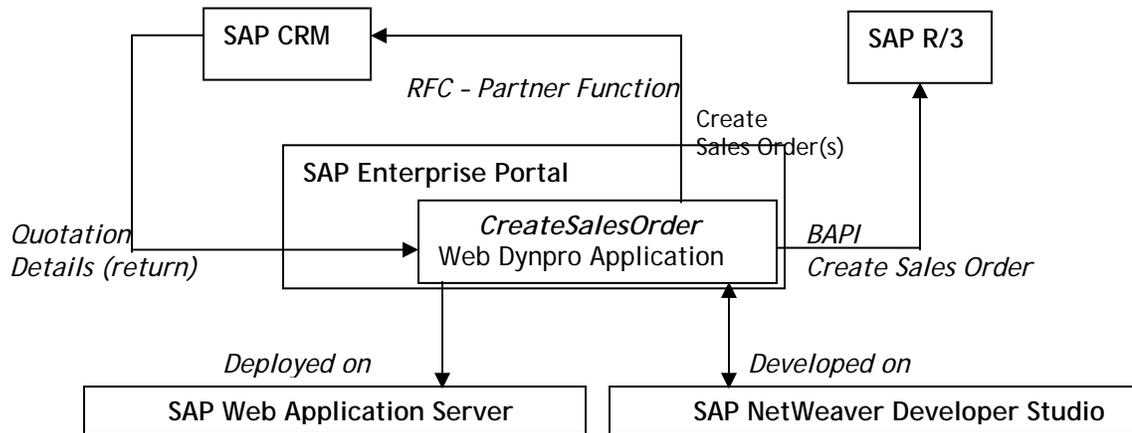

Requirements

Following a structured approach:

Design

The suggested design is as follows:

Solution

Prerequisites/Development Environment *

- SAP R/3 (Developer Rights)
- SAP CRM (Developer Rights)
- SAP NetWeaver Developer Studio
- SAP Web Application Server
- SAP Enterprise Portal

* At Wipro, our development environment for the scenario was: SAP R/3 4.6C, SAP CRM 3.1 SP 03, SAP EP 6.0 SP6, SAP NetWeaver Developer Studio 2.0.6, and SAP Web Application Server 6.40 SP6

Development Process

This can be divided into two areas - ABAP and JAVA. On the ABAP side, the developmental work includes:

1. *Creation of RFC in the CRM System*

An RFC created to retrieve the quotations [Z_RFC_QUOTATIONS]. The *Import* parameters were the Partner Function and the *Return* was the list of quotations for the supplied Partner Function.

2. BAPI – BAPI_SO_CREATE

The details of the quotation(s) to be converted into sales orders are passed onto the standard BAPI. (One could write a wrapper BAPI to BAPI_SO_CREATE in order to pass only desired values to the sales order.)

At the JAVA end, the developmental process includes:

1. JCO settings

Two JCO settings are to be made. These setting are to be made at the Web Dynpro side.

- JCO for connection to SAP CRM, and
- JCO for connection to SAP R/3

2. Web Dynpro Application

- Create a new Web Dynpro Component for the new Project.
- Import the RFC for quotations [Z_RFC_QUOTATIONS] and the BAPI [BAPI_SO_CREATE] as *adaptive RFC models*.
- Design the UI to input the *Partner Function* and display the details of the *Quotation(s)* retrieved for the editing or modification (if required). Also create the navigation schema with the required user actions.
- Add the models as *Used Models*.
- Create the mapping from the *View Controller Context* to the *Controller Context* and to the *model*.

Process Flow

- Create an application for the project. Following this, create a Web Dynpro iView for the application that allows the application deployed over the SAP Web Application Server to be accessed from the SAP Enterprise Portal.

- The Web Dynpro application will connect to the SAP CRM system using the RFC [Z_RFC_QUOTATIONS] to retrieve the quotations for the Partner Functions supplied. The details of the same will be made available to the user in the *Quotations* View. The user can modify the quotation details on-the-fly (if necessary), or else directly from the application trigger the standard BAPI – BAPI_SO_CREATE to create the sales order for the quotation(s).

Conclusion

This *Quotation-to-Sales Order* scenario illustrates the power of creating efficient web applications using the Web Dynpro UI programming technology. There are numerous advantages to this approach, including:

- Effective use of the SAP Enterprise Portal as the single window/interface to access all enterprise applications.
- With user ID/roles mapped, the user can create a sales order on-the-fly without actually logging on to the respective system.
- Clear separation of the UI from application logic.

The Web Dynpro programming model has opened a whole world of opportunities to design and develop web applications with great ease and flexibility. With best wishes to explore and harness the power of the programming model and the entire SAP NetWeaver product suite, I say *ciao*.
