

# Data Governance using SAP MDM - Part 1

## Applies to:

SAP MDM

## Summary

The Data won't Govern itself! This article, first in a two part series, explains the importance of Data Governance and how to establish a framework using SAP MDM. Part 1, focuses on establishing data standards using SAP MDM.

**Author:** Ketan Phanse

**Company:** Wipro Technologies

**Created on:** 29 May 2008

## Author Bio

He has been associated with Wipro Technologies and SAP MDM for more than a year and has completed his Master's in IT and MBA in Systems Management.

## 1. Introduction to Data Governance

"Master Data Management alone cannot be of any use unless Data Governance go along with it", a common statement made every where in almost all articles related to MDM.

The motive of global organizations implementing MDM is not only to have a centralized repository of data and to maintain multiple systems across globe with ease, but also to put in a strong data governance model in picture. As companies grow; organically and inorganically; not only there IT landscape gets complicated but also management of key master data becomes difficult.

Data Governance is broad term but one of the definition Data governance is the practice of organizing and implementing policies, procedures and standards for the effective use of an organization's structured/unstructured information assets.

Another definition of Data Governance is "Data Governance is a system of decision rights and accountabilities for information-related processes, executed according to agreed-upon models which describe who can take what actions with what information, and when, under what circumstances, using what methods."

## 2. Data Governance using SAP MDM

From the above definitions, we can model Data Governance into four layers:

- Data Standards
- Data Administration
- Data Quality
- Process

How does SAP MDM help you achieve this? What are the various options to model the Data Governance using SAP MDM? The below diagram shows how SAP MDM applies the above points into a well structured and highly flexible model.

SAP MDM Data Governance Model

- SAP MDM allows us to create different types of fields and then set multiple properties of each the field to help maintain data standards.
- A User-Role model for data stewardship helps manage data effectively and also impose security and data ownership.
- Maintaining good quality data is one of the most important parts in Data Governance and fortunately SAP MDM provides extensive features like Validations, Assignments and De-duplication strategies for this.
- SAP MDM provides very user friendly GUI to design and build workflows which help to streamline business process and adhere to various compliance policies.

SAP MDM has a strong a foundation of communicating with multiple systems by supporting multiple file formats in Import Manager and Syndicator, ease of communication with R3 using SAP XI. But it also provides an equally strong base for Data Governance.

The following section will give more insight on how to enforce data standards using SAP MDM.

### 3. Data Standards

Often it is seen that organizations fail to recognize the importance of setting some basic data standards in the initial master data design stage. There more focus is on data consolidation and harmonization, but for that it is more important to study all the consuming systems thoroughly and spending time on each table and field that would be present in the MDM repository.

Setting data standards acts a base for a strong Data Governance model and hence is in the bottom of our pyramid. One way to set high data standards is to come up with a detailed MDM Data Model which would have all the details required. Since data standards would act at very basic field level, every small decision you would take would later have an impact on the MDM.

SAP provides various options at both field as well as table level using which we can model high data standards for successful data governance.

#### 3.1. Fields & Properties

SAP provides many options to create different types of fields; 16 to be precise. Rather than just having few Field Types like Text, Integer, Real, we can model fields in SAP MDM having types like Log, Time, Measurement etc. Selecting appropriate field type for a particular field would help in setting good data standards.

Fields					
	Pos.	Name	Type	Keyword	DF
	[44]	Dangerous Goods Profile	Lookup [Flat]	None	
	[82]	Data Quality Vaue	Integer	None	
▶	[3]	Description	Text	None	[2]
	[8]	Division	Lookup [Flat]	None	
	[50]	Document Number Without Doc Mena	Text	None	

Field Detail	
Name	Description
Code	Description
Description	
Type	Text
Required	Yes
Writable Once	No
Matrix	Normal
Multi-Lingual	Yes
Keyword	None
Display Field	Yes
Unique Field	No
Sort Index	Normal
Calculated	No
Calculation	
Width	40
Sort Type	Case Insensitive

**Figure 1: Field Properties**

Field Detail	
Name	Type
Code	Type
Description	
Type	Integer
Required	Auto ID
Writable Once	Boolean
Matrix	Create Stamp
Multi-Lingual	Currency
Keyword	GM Time
Display Field	Integer
Unique Field	Literal Date
Sort Index	Literal Time
Calculated	Log
Calculation	Measurement
	Name
	Real
	Text
	Text Large
	Text Normalized
	Time Stamp
	User Stamp
	Lookup [Flat]
	Lookup [Hierarchy]
	Lookup [Taxonomy]
	Lookup [Qualified Flat] (multi-valued)
	Lookup [Image]
	Lookup [Sound]
	Lookup [Video]
	Lookup [Ext. Binary Object]
	Lookup [Text Block]
	Lookup [Text HTML]
	Lookup [Copy Block]
	Lookup [PDF]

**Figure 2: Field Types**

As seen in the above figure, Field Type is only one of the options for a Field Property. In SAP MDM, we can drill down to setting detailed properties of each field which would decide its behavior. For example if the Required property is set to “Yes” then it becomes a mandatory field, and setting Unique Field to “Yes” would make it a key field which cannot be repeated in a table. Similarly other properties such as Writable Once, Multi-Lingual, Calculated, Width can be set to adhere to required data standards.

### 3.2. Tables

Every field would belong to a particular table and a set of tables would form an MDM repository. To set data standards at a table level, SAP provides creating of different table types. Modeling a table would organize a set of fields into a particular structure which helps to impose rules and restrictions.

In SAP MDM, we can model around four different types of tables (besides BLOB, Main table and others) which are Lookup, Qualified, Hierarchy and Taxonomy.

We can also set certain properties for each table as seen in figure below.

Tables			
	Name	Type	Display Fields
	ABC Indicators	Flat	Name
	Account Assignment Groups	Flat	Name
	Alternate UOM	Qualified Flat	Alternate Unit
	APO relevant	Flat	Name
	Automatic Purchase Order Allowed	Flat	Name
	Backflush Indicator	Flat	Name
	...	...	...

Table Detail	
Name	Alternate UOM
Code	Alternate_UOM
Description	
Type	Qualified Flat
Display Fields	Alternate Unit
Unique Fields	
Key Mapping	Yes
Hide Table	No

**Figure 3: Table Properties**

## Lookup Tables

Lookup tables provide a very effective way of setting data standard and quality. They are tables containing a limited set of values that can be assigned to a particular field, thereby restricting the user to enter anonymous values.

Id	727
Material Number	20613994116790
Description	NOUN1 TESTDEMO\WORK5 DESC1
Material Type	Finished products (ZFRT)
Industry Sector	Medical Products
CFN/Product Number	Chemical industry
Base Unit	Mechanical engineering
Material Group	Medical Products
GFS / PCode	Pharmaceuticals
Division	Plant engin./construction
Product Hierarchy	Retail
Product Hierarchy	Loca Lisa Cases
Cross Plant Material Status	Approved Design
Cross plant status validity date	03/20/2008

Figure 4: Lookup Table

## Qualified Tables

Qualified tables are used to model more complex relations such as 1-n relations, cross referencing etc. The below example shows a material being extended with multiple Valuation Areas and maintaining a set of values per valuation area.

Material Valuation [7 of 7] <input checked="" type="checkbox"/> Filter	1000 1032 1134 1138
Alternate UOM [1 of 1] <input checked="" type="checkbox"/> Filter	C Valuation area: 1134 Valuation Type: LAND 1 Valuation Category: Origin Price Control Indicator: Standard price
Sales Data [5 of 5] <input checked="" type="checkbox"/> Filter	S Standard Price: 10.00 S Valuation Class: Finished Goods - Mfd S Planned price 1: 12 S Price Unit: 4 S Material Origin: Yes

Figure 5: Qualified Table

## Hierarchy Tables

Hierarchy tables generate a tree like structure and a particular leaf node can be assigned to a field. This not only arranges the data in systematic way, but also helps you maintain data standard.

GFS / PCode	Hancock I	Material Valuation	1032
Division	Diabetes	[7 of 7]	1134
Product Hierarchy	Loca Lisa Cases	<input checked="" type="checkbox"/> Filter	1138
Cross Plant Material Status		Alternate UOM	Carton
Cross plant status validity date		[1 of 1]	
Item Category Group		<input checked="" type="checkbox"/> Filter	
Gross Weight		Sales Data	S001
Net Weight		[5 of 5]	S001
Weight Unit		<input checked="" type="checkbox"/> Filter	S001
Volume			S001
Volume Unit			

## Taxonomy Tables

Taxonomy tables are enhanced hierarchy tables used for classification data. They create a hierarchy with characteristic (attribute) value relation.

The screenshot shows two SAP MDM tables. The 'Taxonomy' table on the left displays a hierarchical tree structure of categories, including 'Consumables & Maintenance Solutions', 'Safety Products', 'Personal Protection', 'Eye/Face Protection', 'Goggles', 'Spectacles', 'Lenses & Windows', 'Eye/Face Protection', 'Eye Gear', 'Ear Protection', 'Head Protection', 'Hand/Foot & Limb Protection', 'Hand, Power, Machine, & Measuring', and 'Automobile parts'. The 'Attributes' table on the right lists attributes for 'Lens/Window Coating/Filter' with columns for 'Linked', 'Name', 'Type', and 'Alias'. The 'Attribute Detail' view shows the 'Name' as 'Lens/Window Coating/Filter', the 'Alias' as 'Attribute Image', and the 'Definition' as a list of filter types: 'Anti-Scratch', 'Filter 3.0', 'Filter 5.0', 'Anti-Fog', 'Anti-Static', 'Filter 1.7', 'Filter 2.0', and 'Filter 2.5'. The 'Type' is set to 'Text' and 'Multi-valued' is checked.

Taxonomy tables can be used to set good data standards as they help to uniquely assign a set of characteristics to a record.

## 4. Summary

To summarize, before you come down to actual modeling of data governance, one must ask the following questions:

- Where is the data?
- How is the data created, managed and deleted?
- Who owns what data?
- How do you define data standards?
- How bad is the data?
- How does the data flow across organization?

Getting answers to these basic questions is a pre-requisite and then use SAP MDM to put into place data governance to successfully manage your master data.

The article focuses only on the first layer of the Data Governance pyramid i.e. Data Standards. I would be coming up with another detailed article on the other 3 layers namely: Data Administration, Data Quality and Policies and Procedures.
