

Use of Action 'Queuing' in SAP MII

Applies to:

SAP MII 11.5 or higher

For more information, visit the [Manufacturing homepage](#).

Summary

This article will provide some tricky and trials on usage of rarely-used action block named 'Queuing' in MII

Author: Som Sarkar

Introduction

Since long days there is no help documentation or step-by-step guidelines on Queuing Action in MII 12.0. I wonder if I could try my hands to make a TRIAL-N-PLAY to understand the utility of Queuing and look into "How to use Queuing". After a few trials, I finally succeeded to establish the usages and guidelines on Queuing Action for MII developers who want to work or test and apply the concepts of Queue in that action.

Step-By-Steps

Here follows the instructions on Use of Queuing with a small Application on "Managing Employee Data"

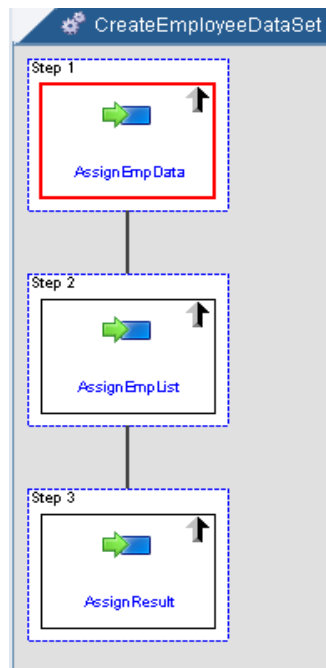

Business Logic Services

Step 1

To develop this Application we need to create two Business Logic Services (BLS) – one for creating Employee Data List (First Name and Last Name), another for managing on Employee Data

Step 2

Let me show you the screenshot of first BLS (BLS_CreateEmployeeData) as shown below:

A. Define 3 Transaction Properties as follows

FirstName

The screenshot shows the 'Property Detail' dialog for the property 'FirstName'. The 'Name' field contains 'FirstName'. The 'Description' field contains 'First Name of an Employee'. The 'Data Type' is set to 'String', and the 'Output Parameter' checkbox is unchecked. The 'Minimum Range' and 'Maximum Range' fields both contain '0'. The 'Value' field is empty.

Name	FirstName
Description	First Name of an Employee
Data Type	String <input type="checkbox"/> Output Parameter
Minimum Range	0
Maximum Range	0
Value	

LastName

The screenshot shows the 'Property Detail' dialog for the property 'LastName'. The 'Name' field contains 'LastName'. The 'Description' field contains 'Last Name of an Employee'. The 'Data Type' is set to 'String', and the 'Output Parameter' checkbox is unchecked. The 'Minimum Range' and 'Maximum Range' fields both contain '0'. The 'Value' field is empty.

Name	LastName
Description	Last Name of an Employee
Data Type	String <input type="checkbox"/> Output Parameter
Minimum Range	0
Maximum Range	0
Value	

EmployeeList

Property Detail

Name
EmployeeList

Description
Get the details of an Employee

Data Type
 Output Parameter

Minimum Range

Maximum Range

Value

```
<?xml version="1.0"
encoding="UTF-8"?><EmpList><Emp><FirstName/><LastName/></Emp></E
mpList>
```

- B. Define 2 local variables as follows

EmployeeData

Property Detail

Name
EmployeeData

Description
Details of Employee

Data Type
 Output Parameter

Minimum Range

Maximum Range

Value

```
<?xml version="1.0"
encoding="UTF-8"?><Emp><FirstName/><LastName/></Emp>
```

EmployeeList

Property Detail

Name
EmployeeList

Description
List of Employee

Data Type
Xml Output Parameter

Minimum Range
0

Maximum Range
0

Value
<?xml version="1.0" encoding="UTF-8"?><EmpList>

- C. Put Assignment Action in the first sequence and map the transaction variables FirstName and Last Name to the nodes FirstName and LastName defined in the Local variable EmployeeData as follows

Link Editor

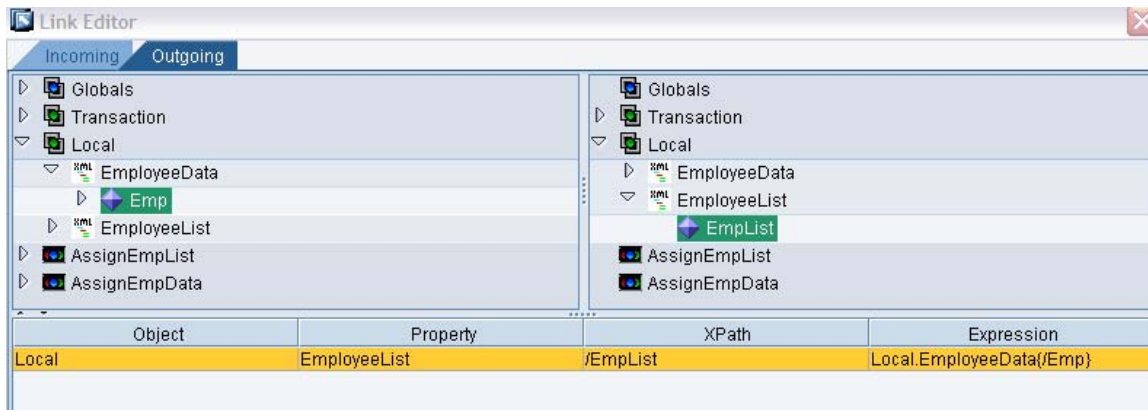

Incoming Outgoing

Globals
Transaction
EmployeeList
 FirstName
 LastName
Local
AssignEmpData

Globals
Transaction
Local
 EmployeeData
 Emp
 FirstName
 LastName
 EmployeeList
 AssignEmpData

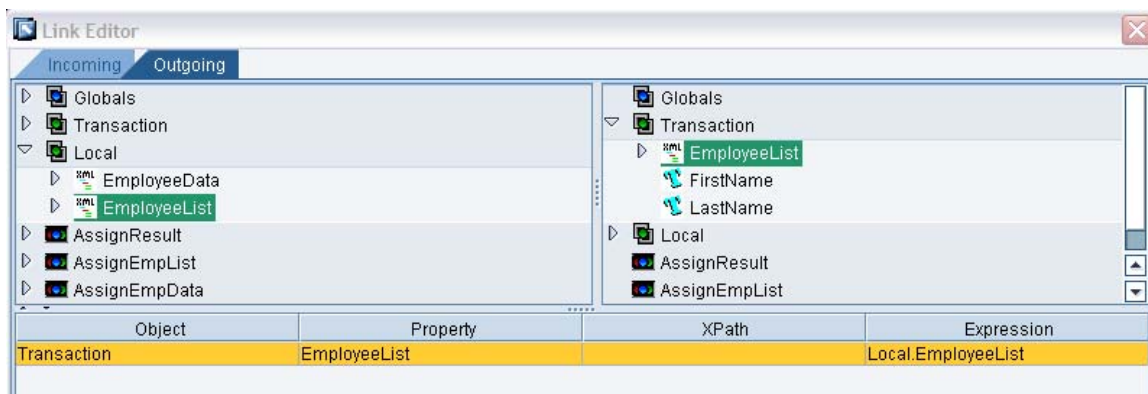

Object	Property	XPath	Expression
Local	EmployeeData	/Emp/FirstName	Transaction.FirstName
Local	EmployeeData	/Emp/LastName	Transaction.LastName

- D. Put Assignment Action in the second sequence and map the node Emp defined in the local Variable EmployeeData to the node EmpList defined in the local variable EmployeeList as follows :

Remember to set the Link Type as '**Append XML**'

- E. Put Assingment Action in the 3rd (last) sequence and map the local variable EmployeeList to the Transaction Variable EmployeeList as follows:

Step 3

Thus we have created a BLS for creating a Data Set for an Employee which will return the Data in the form of XM. Now we will create another BLS for managing on Employee Data which is a combination of all action blocks of Queuing and other some action blocks

Step 4

See the screen shot of BLS (BLS_ManageEmpData) as below :

Screen Shot Image

- A. Define 6 Transaction Properties : EmpID (String, Input), FirstName (String, Input), LastName (String, Input), QueueFlag (String, Input), Message (String, Output) and GetEmployeeData (XML, Output)
- B. Define local variables for 3 MatchValues used for Switch Action : MatchValue1 – PQ (for Queue Put), MatchValue2 – GQ (for Queue Get) and MatchValue3 – DQ (for Queue Delete)
- C. Put the Action 'Queue List' in the first sequence and configure as follows

Queue List Configuration

Maximum Number of Queue Entries: 500

Queue Name: EmployeeList

OK Cancel

- D. Put the Action 'Document' in the 2nd sequence and define 3 columns as follows with all data types as String

Document Configuration

Defined Columns

EmployeeID
FirstName
LastName

Column Properties

Name: EmployeeID

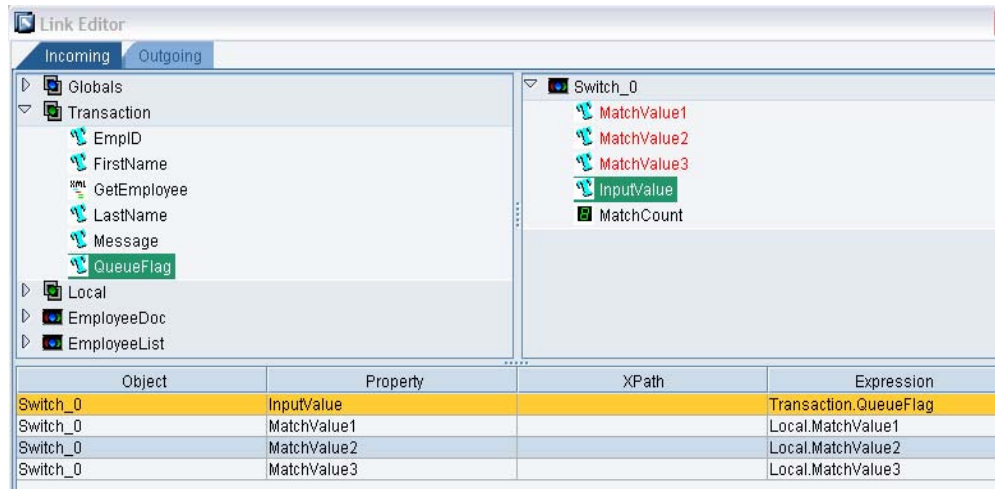

Description: Employee Id

Minimum Range: 0.0

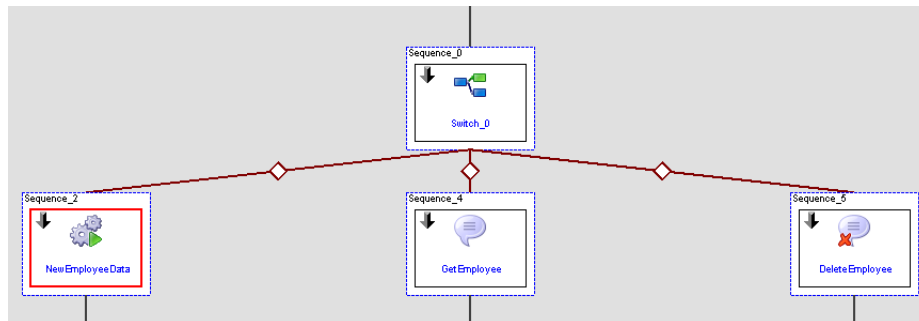

Maximum Range: 1.0

Data Type: String

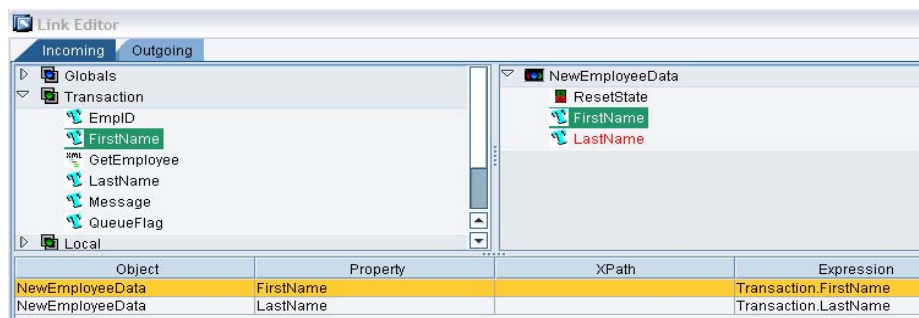

- E. Put the Action 'Switch' in the 3rd sequence and set number of inputs as 3. Configure the links between transaction properties and Switch properties as follows

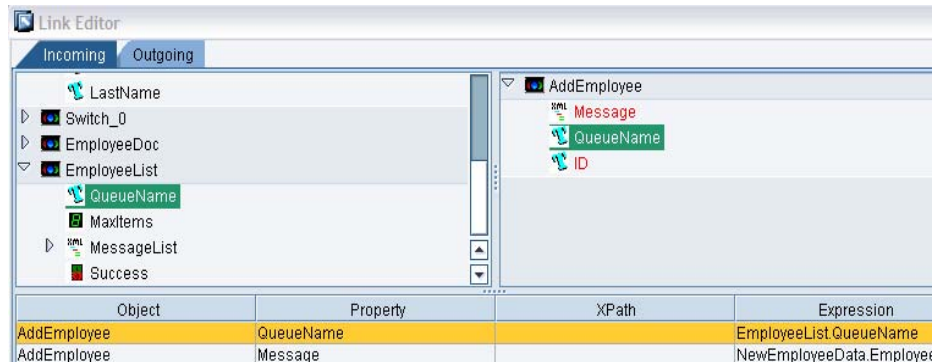

- F. Add 3 sequences under the sequence defined in C. and put the Actions Transaction Call, Queue Get and Queue Delete respectively as shown below:

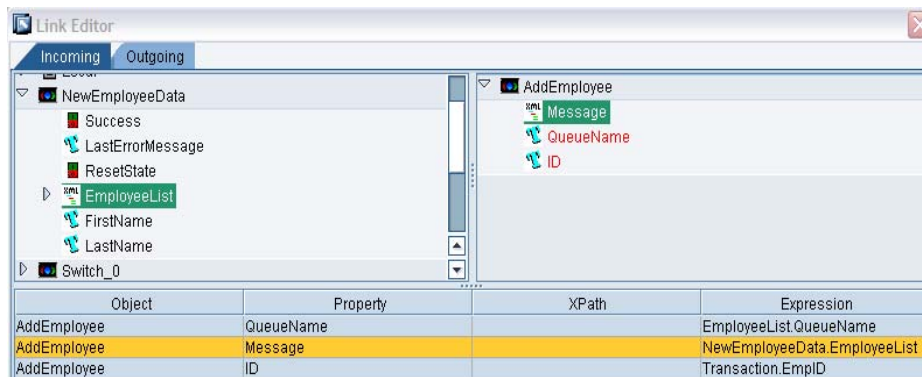

- G. In Action 'Transaction Call', call the transaction which was created in the previous BLS (BLS_CreateEmployeeData) and set the links as follows :

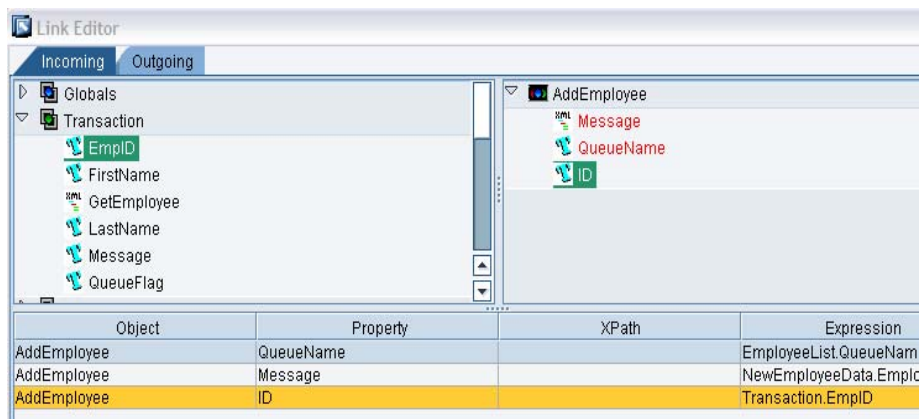

- H. In the next sequence to sequence of Transaction Call, put the Action 'Queue Put'. And set the links of all 3 nodes of the action as follows

Map the node QueueName of the action 'Queue List' (in the left panel) defined in the 1st sequence to the node QueueName of the action 'Queue Put' (in the right panel)

Map the node EmployeeList of the action 'Transaction Call' (in the left panel) defined in the previous sequence to the node Message of the action 'Queue Put' (in the right panel)

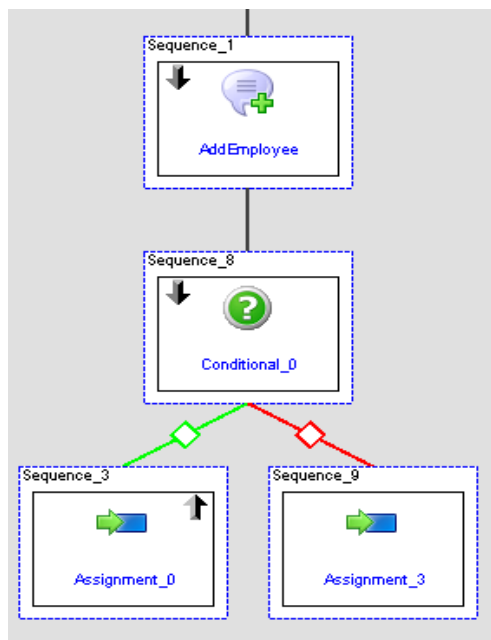

Map the node EmplID of the Transaction (in the left panel) to the node ID of the action 'Queue Put' (in the right panel)

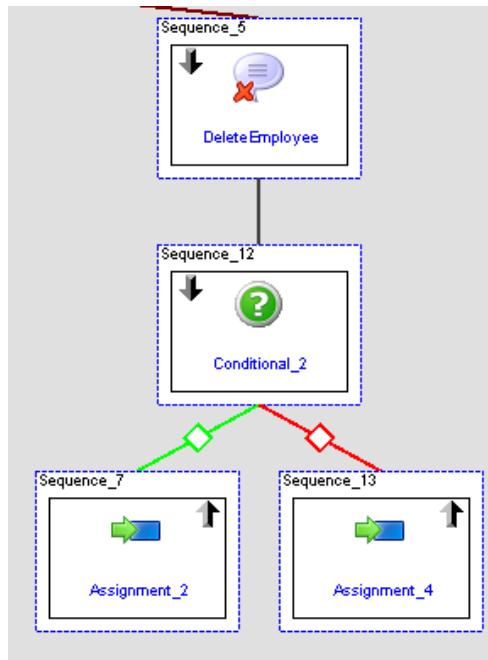

I. In the action 'Queue Get' do the followings

- Map the node EmpID of the Transaction (in the left panel) to the node ID of the action 'Queue Get' (in the right panel)
- Map the node QueueName of the action 'Queue List ' (in the left panel) to the node QueueName of the action 'Queue Get' (in the right panel)

J. Similarly do the same needful things for the action 'Queue Delete'

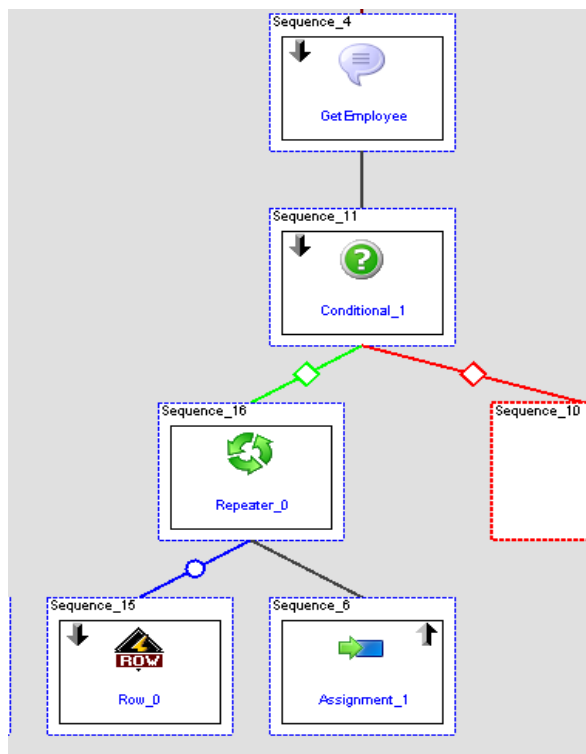

K. In the next sequence to the sequence of 'Queue Put' and 'Queue Delete' put remaining actions as follows

- The action 'Condition' will check the success of the operation of 'Queue Put'/'Queue Delete'
- On success of the operation, Assign the local variable (PQ_Message/DQ_Message) to the Transaction variable (Message)
- On Failure of the operation, similarly assign the local variable (PQ_ErrorMsg/DQ_Message) to the Transaction variable (Message)

L. In the next sequence of 'Queue Get' put the actions as follows :

- Check the success of the action 'Queue Get'
- On Success of the action, loop the Message (XML node) of the 'Queue Get' with XPath Expression `GetEmployee.Message/EmpList/Emp`
- Then append the employee data (First Name and Last Name) from the message loop and ID node of 'Queue Get' to the corresponding columns defined in the XML Document created in previous step (B)
- Finally assign the XML document output to the transaction output variable.

Step 5

Thus we have created the BLS which will manage the Employee Data with three operations : Add employee (Using 'Queue Put'), Get Employee (Using 'Queue Get') and Delete employee (Using 'Queue Delete')

Step 6

Now we can test the use of Queuing for all three functionalities with the help of Xacute Query as follows

1. Add Employee :

- In an Xacute Query, select the Transaction we have created previously.
- Set the Output Parameter with 'Message' from the list of available output parameters of the selected transaction
- Assign the input parameters as shown below
- Enter values for Employee Id, FirstName and Last Name
- Enter 'PQ' for the Flag for Queuing operation (for the action 'Queue Put')
- Execute the Xacute Query

2. Delete Employee :

- In an Xacute Query, select the Transaction we have created previously.
- Set the Output Parameter with 'Message' from the list of available output parameters of the selected transaction
- Assign the input parameters as shown below
- Enter values for Employee Id and leave the input parameters for FirstName and Last Name as blank
- Enter 'DQ' for the Flag for Queuing operation (for the action 'Queue Put')
- Execute the Xacute Query

3. Get Employee :

- In an Xacute Query, select the Transaction we have created previously.
- Set the Output Parameter with 'GetEmployeeData' from the list of available output parameters of the selected transaction
- Assign the input parameters as shown below
- Enter values for Employee Id and leave the input parameters for FirstName and Last Name as blank
- Enter 'GQ' for the Flag for Queuing operation (for the action 'Queue Put')
- Execute the Xacute Query

Here, we are now able to use Queuing Action in MII 12.0.
