Last Updated: December 11, 2006

**NOTE:** Anything that is highlighted using red font indicates that it is an update, addition or correction made after the original release of this document that shipped with this product.

**The Data Quality XI Product Platform Matrix (PPM) serves to define the supported platform information for DQ XI. This document will only serve to communicate information about what Data Quality XI currently supports.**

This document is broken down into multiple worksheets each representing different platforms which DQ XI is built on. All worksheets have filters for each column so you can easily filter the information to find out if what you're looking for is supported by DQ XI. Below are descriptions of each of the sheets:

**DQ XI Data Quality Server** - Describes Operating System (OS), Hardware, and build information. NOTE: 32-bit applications will run on a 64-bit OS. Currently DQ XI is only built as a 32-bit application. Pay close attention to the "Hardware" column as many OS vendors

**DQ XI Web Tier Applications** - This worksheet describes web server (also referred to as application server sometimes) support for all of the various web applications which are part of the DQ XI platform. This current includes the web services and the Project Portal.

**DQ XI Databases** - This worksheet describes database support for DQ XI. An important thing to note is that we're really only interested in the database client. The IQ8 Data Quality server directly interfaces with a databases client software. When determining if we support a customers database we should be looking at the database they have and the OS they plan on running the DQ XI Data Quality Server on. That will determine if we support it or not. There are cases where a customer may have their database server on an OS which we don't support but as long as they have a client which will work on the OS configuration where the Data Quality Server will run, we will work with that server just fine.

**DQ XI Client Applications** - This worksheet covers the client applications (non-web based) which are part of the DQ XI platform. This includes items such as the command line client for executing projects as well as the Project Architect which customers use to design data quality projects.
