SAP NetWeaver "How-to" Guides are intended to simplify the product implementation. While specific product features and procedures typically are explained in a practical business context, it is not implied that those features and procedures are the only approach in solving a specific business problem using SAP NetWeaver. Should you wish to receive additional information, clarification or support, please refer to SAP Consulting.

Any software coding and/or code lines /strings ("Code") included in this documentation are only examples and are not intended to be used in a productive system environment. The Code is only intended better explain and visualize the syntax and phrasing rules of certain coding. SAP does not warrant the correctness and completeness of the Code given herein, and SAP shall not be liable for errors or damages caused by the usage of the Code, except if such damages were caused by SAP intentionally or grossly negligent.

# 1 Scenario

When building analytical applications, these are some guidelines to follow when transporting models.

## 2 Introduction

This paper will show the process to transport analytical models within SAP NetWeaver Visual Composer. The suggested application is to install SAP NetWeaver Visual Composer storyboard in a development environment. You will then deploy the models in the development environment. When you deploy the model, you are creating iViews. You will not transport the model within the storyboard. You will transport the compiled iView that has been deployed to the portal.

Keep in mind:

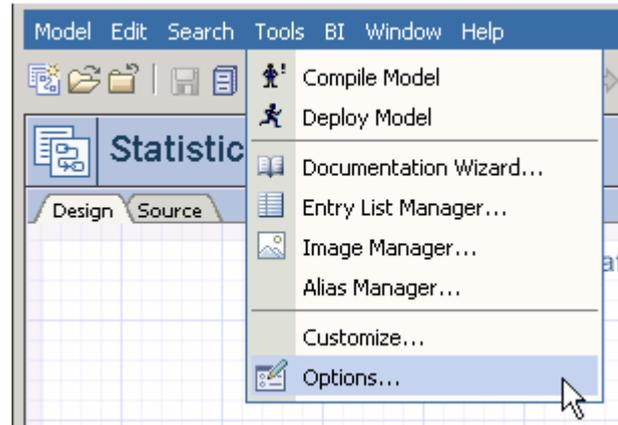

- When transporting iViews, make sure you transport both the delta link and the base iView.
- Make sure the par files are included in the transport. SAP NetWeaver Visual Composer iViews have a required par file that is created and needs to be transported.
- Make sure the localization file is in the transport. SAP NetWeaver Visual Composer iViews have a required localization file that is created and needs to be transported.
- Ensure that the PAR ID Prefix is the same as the transport prefix id. When the “par” and “localization” files are created, they are not put in the same namespace as the iView. Therefore, to make sure these objects are collected in the transport, you will have to define the prefix of the iview, par, and localization files as the same as the transport within SAP NetWeaver Visual Composer.

### 3 The Step By Step Solution

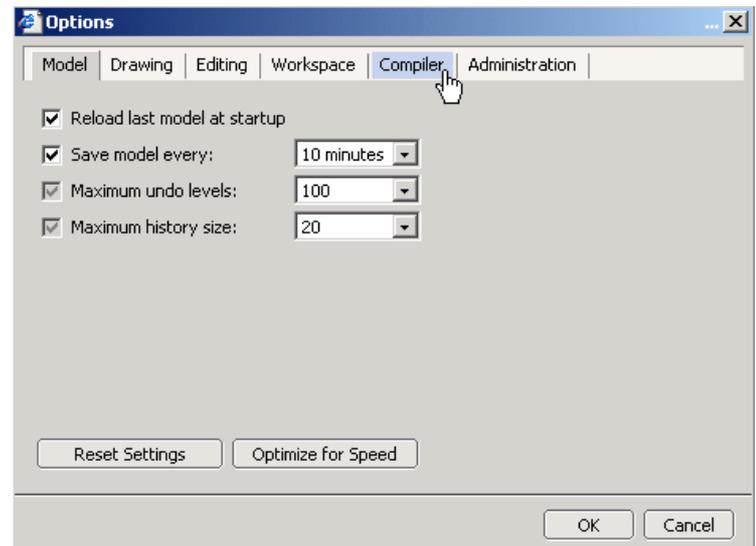

To transport analytical models, follow these steps.

#### 3.1 Set the PAR ID Prefix

1. Within Visual Composer, choose Tools -> Options

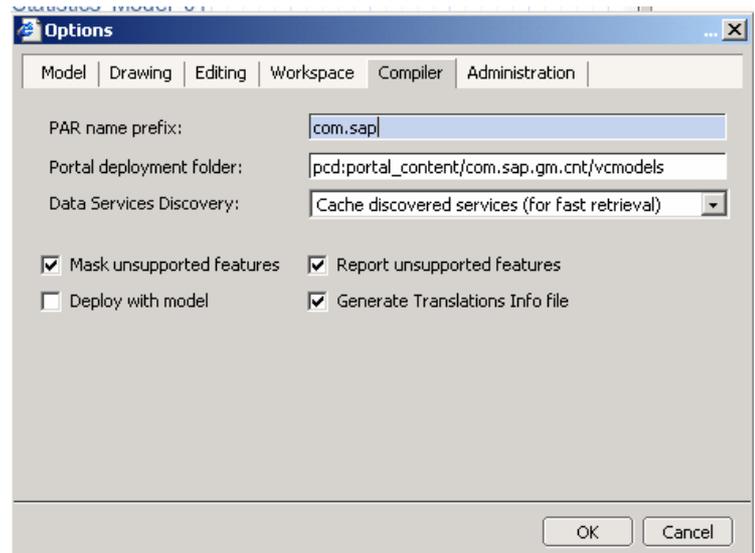

2. Click on the "Compiler" Tab.

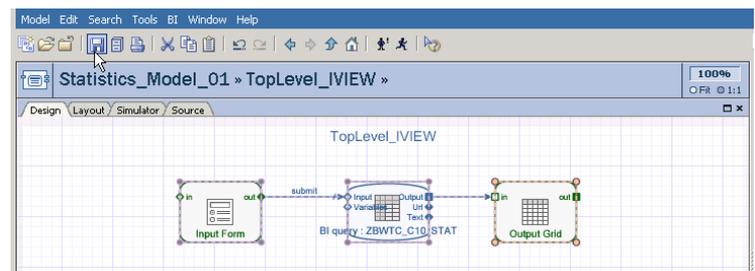

- Update the “PAR name prefix” field to your desired namespace. Make sure that when you create a transport, you use the same namespace you are using for this model! Choose OK.

In this example, we used “com.sap” as our prefix.

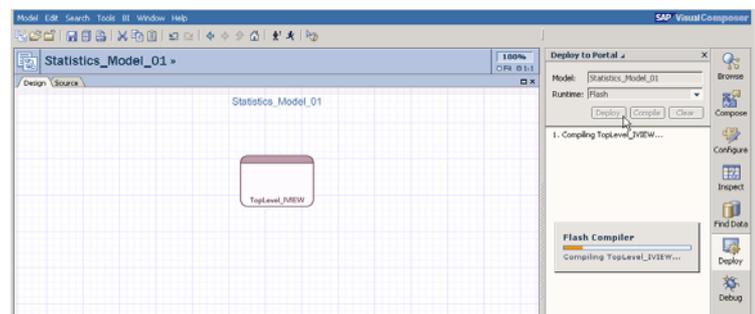

### 3.2 Build and Deploy your analytical model.

- Build an analytical application and save the model. We've saved the model as “Statistics\_Model\_01” in this example.

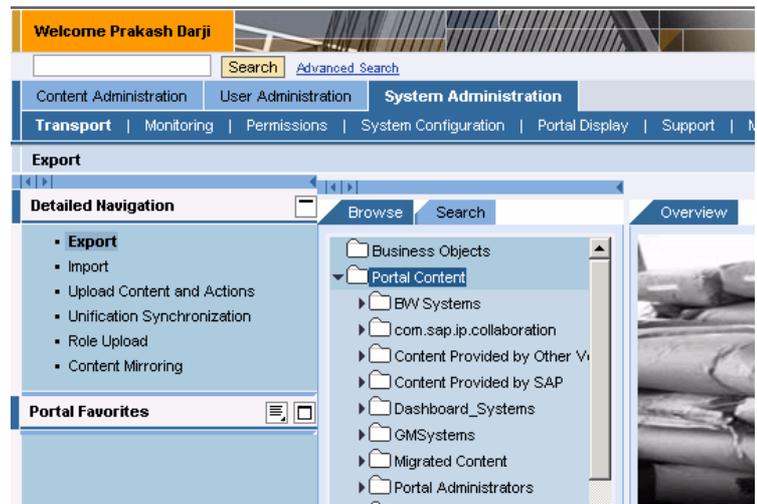

- Go to the “Deploy” icon on the right and click the Deploy button at the top level of your model. In this case, we only have one iView in this model.

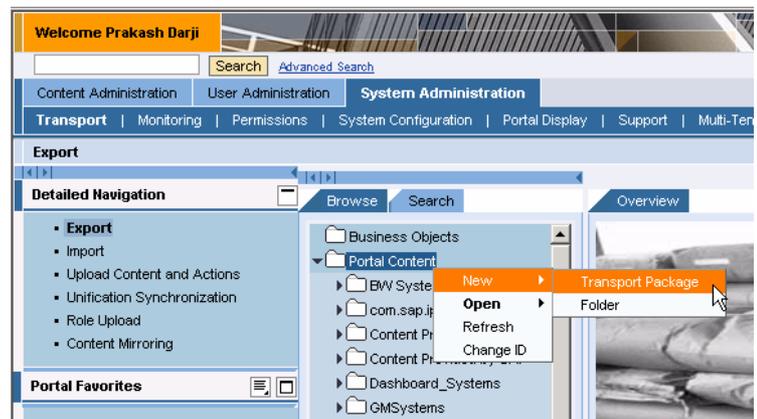

### 3.3 Collect and Transport your Model

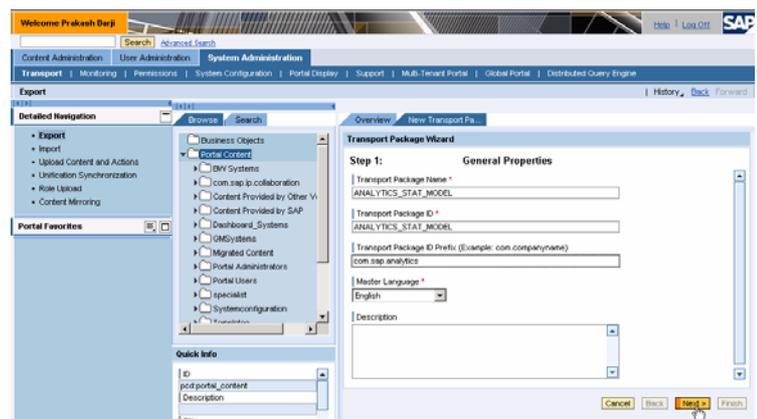

6. Login to your source Portal and navigate to System Administration -> Transport -> Export

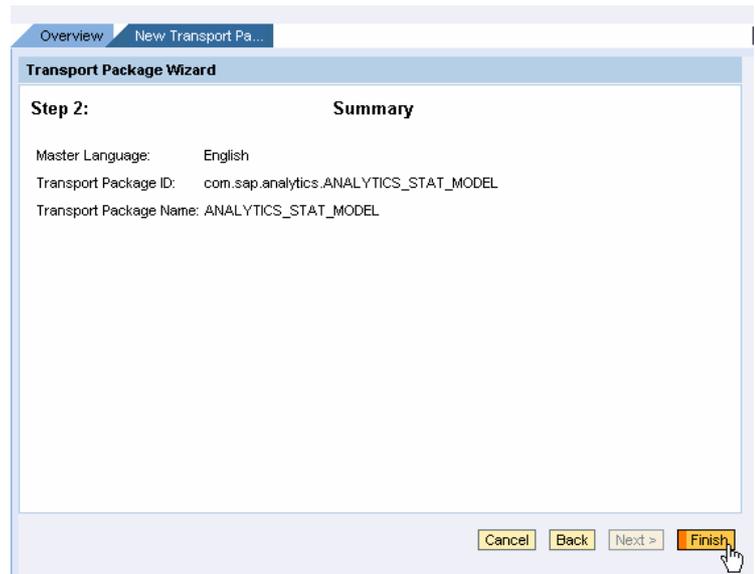

7. Right click on the "Portal Content" and create a new Transport Package.

8. Name the transport package and click "Next". Make sure the Transport Package ID is in the same namespace as specified in Step 3.1 (in this case "com.sap").

- After naming the package, click “Finish”.

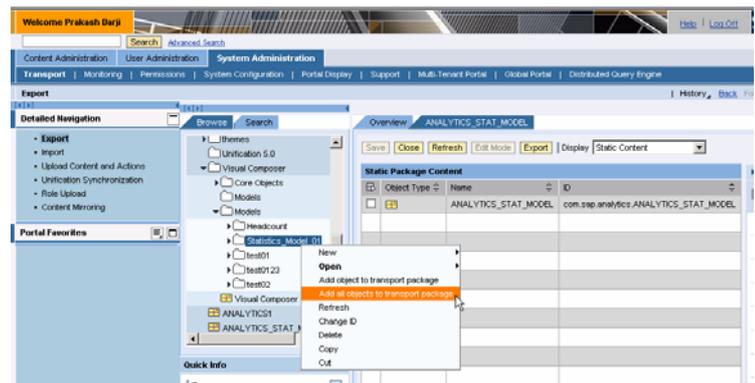

- Click “OK” when prompted to “Open the Object for editing”.

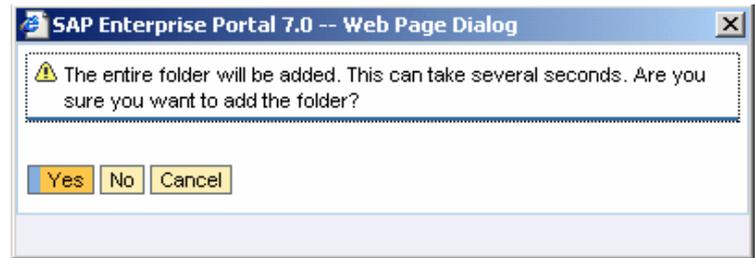

- While the transport package is open, browse the “Portal Content” and navigate to “Visual Composer -> Models” and right on the folder that contains the model you deployed within step 3.1. Click “Add all objects to transport package”.

Note: If you have created a delta link iView to a model within this folder, you would add that delta link iView to the transport as well as this base folder.

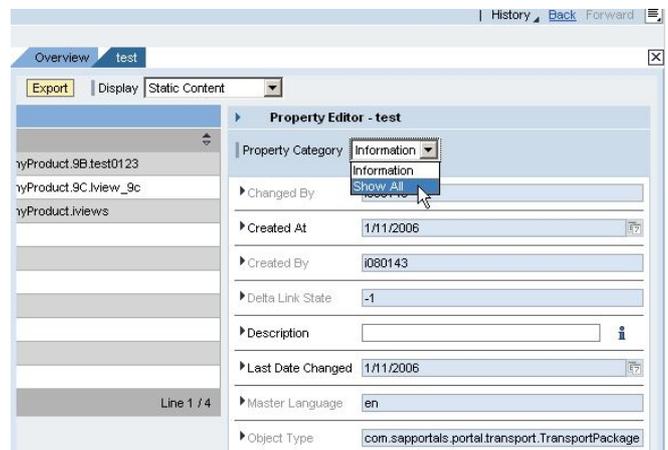

12. When prompted, if you want the entire folder added, click “Yes”.

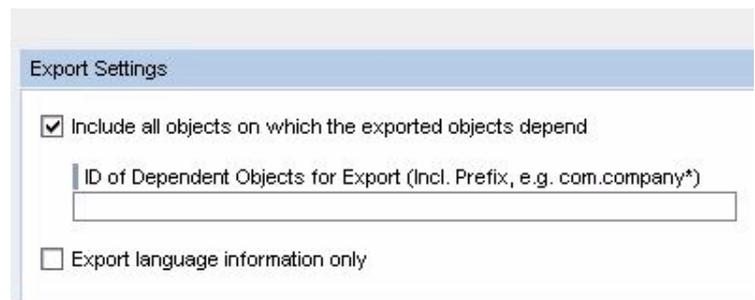

13. Within SAP NetWeaver '04, you will have to choose “Show All”.

SAP NetWeaver '04:

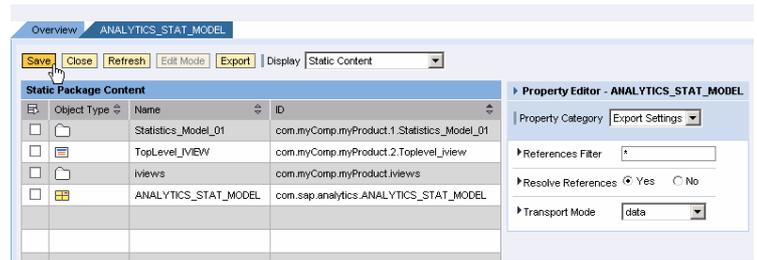

14. Within SAP NetWeaver '04, you will have to make sure that the Export Settings is set to “Include all objects on which the exported objects depend”. Also, make sure the ID of Dependent Objects for Export is set to the namespace specified in Step 3.1 (in this case “com.sap”).

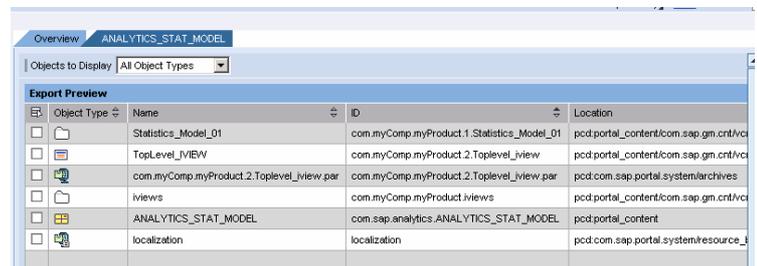

SAP NetWeaver '04:

15. Save your transport.

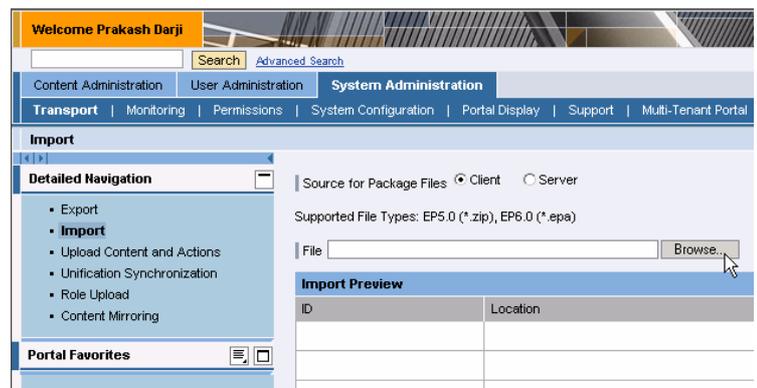

16. Ensure that the “par” file and “localization” file are collected in your transport, and hit Export!

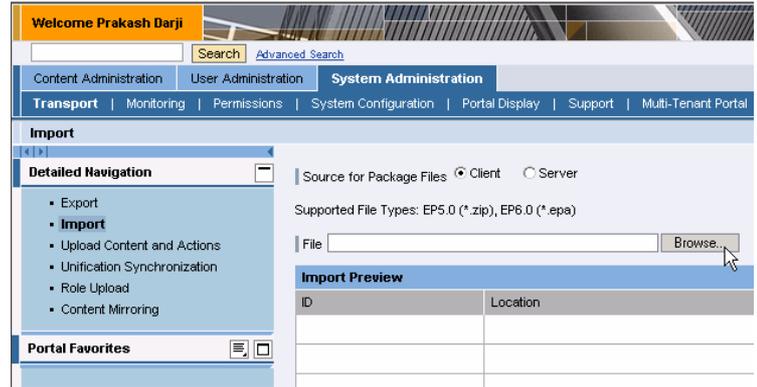

### 3.4 Import your Analytic

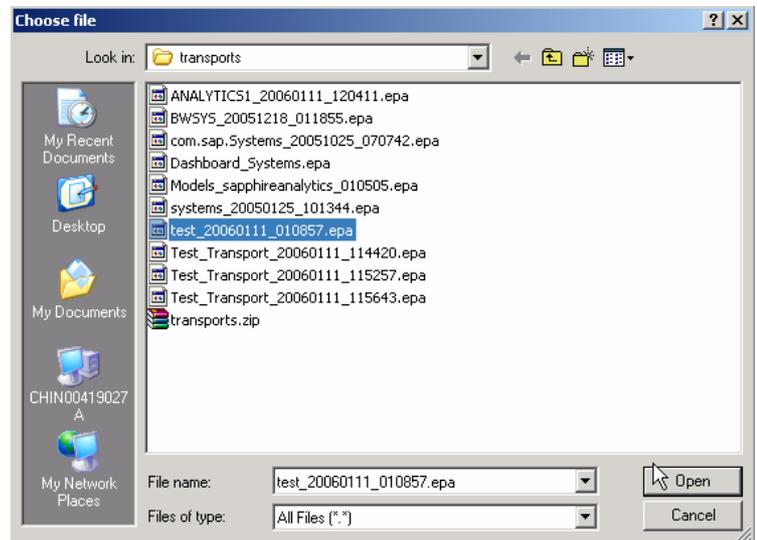

17. Login to your target Portal and navigate to System Administration -> Transport -> Import

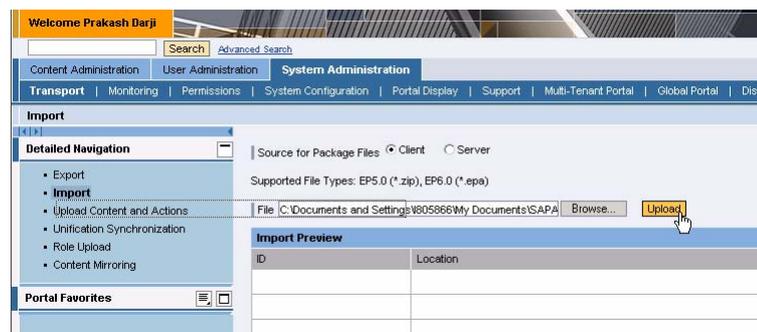

18. Click on Client and choose “Browse”

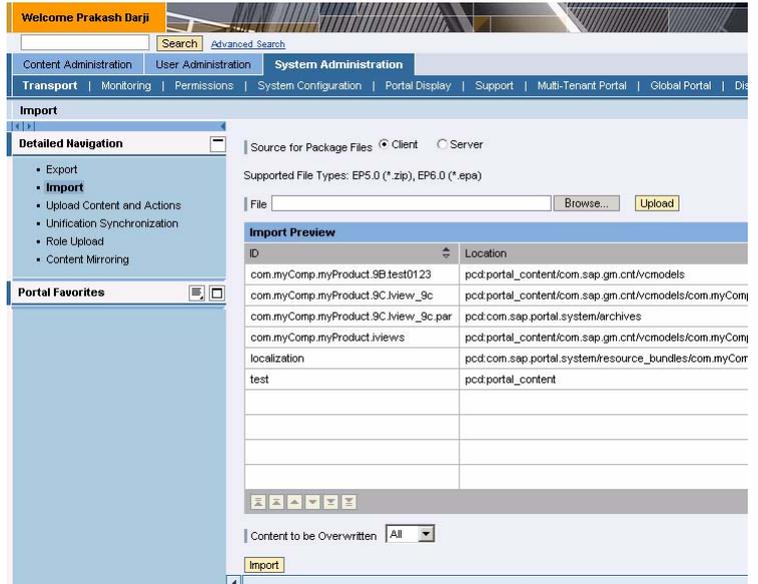

19. Choose your import package that was exported in section 3.2 and select “Open”

20. Click “Upload”

## 21. Select “Import”

The screenshot shows the SAP System Administration interface for the 'Import' function. The top navigation bar includes 'Content Administration', 'User Administration', and 'System Administration'. The 'Import' section is active, with a sub-menu on the left containing 'Export', 'Import', 'Upload Content and Actions', 'Unification Synchronization', 'Role Upload', and 'Content Mirroring'. The main area is titled 'Import' and features a 'Source for Package Files' section with radio buttons for 'Client' (selected) and 'Server'. Below this, it lists 'Supported File Types: EP5.0 (\*.zip), EP6.0 (\*.epa)' and a 'File' input field with 'Browse...' and 'Upload' buttons. An 'Import Preview' table is displayed, showing a list of content items with their IDs and locations. At the bottom, there is a 'Content to be Overwritten' dropdown menu set to 'All' and an 'Import' button.
