

BusinessObjects XI .NET Providers Deployment Guide

BusinessObjects XI .NET Providers let you build a BusinessObjects Enterprise web application with minimal coding. The web application you build allows users to log on to a BusinessObjects system, browse folders, and view reports and other documents.

BusinessObjects XI .NET Providers are enhancements to the BusinessObjects Enterprise XI Release 2 SDK.

BusinessObjects XI .NET Providers have two features:

- The *design-time* feature lets you build web applications that use BusinessObjects XI .NET Providers.
- The *runtime* feature lets you run web applications that use BusinessObjects XI .NET Providers.

Consult this table to see which features are included in your installation:

Is Visual Studio 2005 installed on your computer?	Is .NET Framework 2.0 installed on your computer?	BusinessObjects XI .NET Providers features installed
Yes	Yes (.NET Framework 2.0 is installed with Visual Studio 2005)	Runtime and design-time.

Is Visual Studio 2005 installed on your computer?	Is .NET Framework 2.0 installed on your computer?	BusinessObjects XI .NET Providers features installed
No	Yes	Runtime only. To install the design-time features, install Visual Studio 2005. Then, run the BusinessObjects XI .NET Providers Standalone Install or Crystal Reports Server Install.
No	No	No components installed. To install only the runtime feature, install .NET Framework 2.0. Or, to install both runtime and design-time features, install Visual Studio 2005. Then, run the BusinessObjects XI .NET Providers Standalone Install or Crystal Reports Server Install.

Note: (This note applies only to users of Crystal Reports Server XI R2.) To successfully install BusinessObjects XI .NET Providers, the .NET Framework 2.0 or Visual Studio 2005 must be installed before the Crystal Reports Server is installed. If Crystal Reports Server was installed first, you must reinstall it.
